

Pseudomonas in the NICU and Nurseries

What is Pseudomonas?

- Pseudomonas is a germ or bacteria found in soil, water, plants and animals.
- It is able to grow and survive in standing water and solutions containing disinfectants.
- In newborns, Pseudomonas is mainly found in the stool.

Can Pseudomonas be treated?

- Yes. If there is a Pseudomonas infection, antibiotics are usually given.
- Sometimes Pseudomonas is found but there is no infection. This is called the carrier state.

How is Pseudomonas spread?

- Pseudomonas can be spread by touching babies who have it or by sharing items that have been used in their care.
- It can be found on counter tops, faucets, and in sinks and can be picked up on hands.
- Using Contact Precautions helps prevent the spread of Pseudomonas.

What are Contact Precautions?

Contact Precautions help reduce the risk of spreading infection to babies, visitors and staff. If your baby has Pseudomonas, they are put in Contact Precautions. This means:

- A sign is put up to let staff, parents and visitors know about Contact Precautions.
- When entering the area or room, everyone must clean their hands and wear the gowns and gloves provided.
- Anyone, including parents, helping with your baby's care must wear a gown and gloves.
- Before leaving the room, everyone must take off their gowns and gloves and clean their hands.

<p>Stop the spread of germs and infection. Clean your hands.</p>
